A: Because.txt files are plain text, so you can open them in a plain text editor such as notepad to see their content and then remove them. For more in depth instructions visit Remove all.txt files A: You can use Powershell if you have installed it on your Windows system. For example: \$files = dir foreach (\$file in \$files){ if (\$file.name -match '.txt'){ Remove-Item -Path \$file.FullName -Force } } Q: Is it possible to create objects at runtime in.Net? I have multiple classes that share a method in which I do some data operations. I would like to factor out this shared code so that the classes will be able to use an interface that exposes the shared method. But I am not sure if it's a good approach because I'd like to keep the static methods out of the classes where the objects are created. Here is a concrete example: public interface IOrderDataProcessor { OrderStart CreateOrderObject(string myOrder); } public class AOrderDataProcessor : IOrderDataProcessor { public OrderStart CreateOrderObject(string myOrder) { //do some data operations to create an order } } public class BOrderDataProcessor : IOrderDataProcessor { public OrderStart CreateOrderObject(string myOrder) { //do some data operations to create an order } } Let's assume that at runtime I want to create two objects of class AOrderDataProcessor and one object of class BOrderDataProcessor. Is it possible to create objects using runtime type of some variable? A: Use the Activator class. Here's a simple example: var dataProcessor = (IOrderDataProcessor)Activator.CreateInstance(typeof(AOrderDataProcessor)); A: No, you cannot create objects at runtime. A good approach would be a Factory or a Factory method as an extension to your interface, or something along the lines of this: public interface IOrderDataProcessor {
